SilverSteps

Ageing Well in Place: AI that finds the paths Singapore's seniors depend on and ranks what to fix first.

SilverSteps uses AI to find the paths Singapore's seniors depend on, spot what makes them unsafe, and let residents vote on what to fix first, so every dollar of upgrades helps the most people.

Residential developers

- See which paths seniors around a site depend on before designing linkways, drop-off points and seating.
- Put barrier-free access, covered linkways and rest points where they will be used most.
- Show buyers and approving agencies that a project supports ageing in place.
- Gather resident feedback through votes instead of costly surveys and town halls.

Elderly residents and caregivers

- Safer daily walks to the market, clinic, bus stop and eldercare centre.
- A direct say: confirm, reject or report barriers, and votes move fixes up the list.
- Mobility-aid and low-vision views show what affects them specifically.
- Supports staying independent and active in their own neighbourhood for longer.

Town councils and agencies (HDB, LTA)

- Ranks fixes by how many seniors each would help, so limited budgets go further.
- Shows why each fix ranks where it does: demand, severity, effort and likely owner.
- Uses HDB Town Design Guide terms and recognises works already planned.
- AI photo checks and resident reports cut down on manual site audits.

Businesses (hawkers, shops, clinics, eldercare)

- Better walking routes bring more senior foot traffic to neighbourhood centres.
- Shows which paths lead customers to the door and where access falls short.
- Supports location choices and the case for nearby improvements.

Environment and community

- Safer walking cuts reliance on taxis and private-hire rides for short trips.
- Shelter, seating and lighting go where they are used, avoiding blanket builds.
- Encourages walks to parks and fitness corners for active ageing.
- Resident voting builds community ownership of the neighbourhood.

Healthcare and social services

- Easier routes to clinics and eldercare support preventive care and fewer missed visits.
- Fewer fall-risk spots (steps, raised kerbs, rough surfaces) on busy senior routes.

Why it is credible

- Built on official open data (SingStat, data.gov.sg, OneMap) and OpenStreetMap.
- Every number is labelled as an estimate; AI findings show their confidence.
- No individual tracking: walking flows are modelled and resident routes are anonymous.
- Scales nationally across every HDB region.
